

REINERT Case Study

THE CHALLENGE

When Reinert's drivers were travelling between countries, or moving close to borders, managing roaming charges was difficult, and resulted in enormous unnecessary costs.

Reinert were concerned that drivers were using their mobile devices and the possibility that this could lead to accidents. An accident related to the mis-use of a company device could cause significant financial and reputational damage.

Reinert management were concerned about the length of time and associated costs of setting up and configuring mobile devices and supporting issues.

PROGET SOLUTION

Reinert administrators can manage mobile devices to prevent the inadvertent connection to foreign carriers, thus avoiding inadvertent roaming charges. The Proget solution also blocked the SIM card from being used in any other device other than that specified by the company.

The Proget solution can detect movement of a device. Reinert were able to lock applications when the device exceeded a customizable speed, effectively disabling applications such as social media or video streaming, ensuring that the driver's attention was firmly on the road.

Proget enables zero touch enrolment and delivery of applications to devices, meaning that any new device can be configured remotely and quickly. Using the remote desktop, an administrator can provide support to a user, ensuring minimal interruption to the business.

BUSINESS BENEFITS

- Significant cost reduction
- Increased driver safety and protection of company reputation and brand.
- Rapid configuration and deployment and minimised down-time of remote devices increasing business efficiency.
